CONSIDERATIONS IN UTI DETECTION AND POTENTIAL IMPACT ON ANTIBIOTIC STEWARDSHIP

ERIN H. GRAF, PHD, D(ABMM)

Director, Infectious Disease Diagnostics Laboratory

Assistant Professor, Clinical Pathology and Laboratory Medicine, Perelman School of Medicine at the University of Pennsylvania

Children's Hospital of Philadelphia®

LEARNING OBJECTIVES

- Describe the traditional and advanced methods for diagnosing UTIs and their impact on patient care
- Examine how the inappropriate use of antibiotics to treat UTIs has led to increased antibiotic resistance
- Discuss the effects of UTI diagnosis and treatment on healthcare dollars, time, and patient outcomes

OUTLINE

- Clinical context
- Current diagnostic testing
- Over-treatment and antimicrobial resistance
- Emerging methods for UTI diagnosis
- Potential impact of emerging methods on antimicrobial stewardship

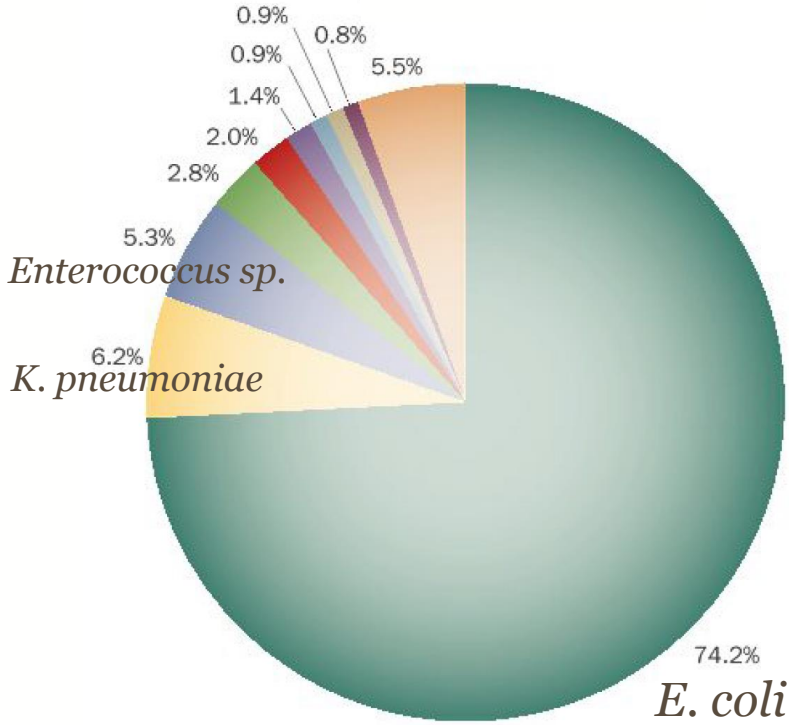
URINARY TRACT INFECTIONS

- A leading cause of health care visits
  - Estimated >8 million adult health care visits
  - Estimated >1 million pediatric visits
  - Estimated >$3 billion in annual health care spending in the US
  - Lifetime risk of ~50% for women
- Leading cause of nosocomial infection
  - Catheter-associated UTIs in long-term care facilities and hospitals

Hooton, *NEJM*, 366 (11), 2012
Griebling, *J Urol*, 173 (4), 2005

URINARY TRACT INFECTIONS

- A leading cause of antibiotic prescriptions
  - Prevent pyelonephritis, urosepsis
- Empiric therapy for uncomplicated cystitis
  - Selection may depend upon local antibiogram
- Culture-guided therapy for pyelonephritis
- Culture-guided therapy for complicated UTI



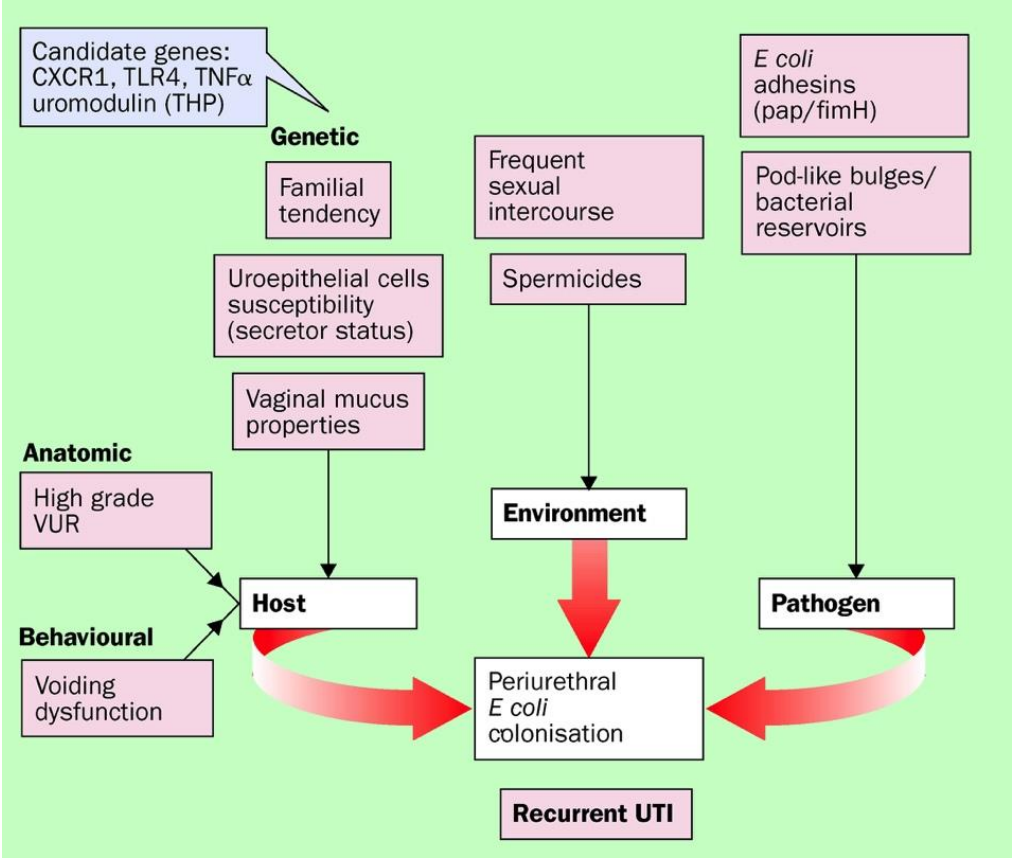
Foxman, *Nat Rev Urol* 7(12) 2010

Gupta et al, *CID* 52(5) 2011
Hooten et al, *CID* 50(5) 2010

Children's Hospital of Philadelphia®

URINARY TRACT INFECTIONS

- Risk factors
  - Host
    - Genetics
    - Anatomy
  - Behavior
  - History of UTI

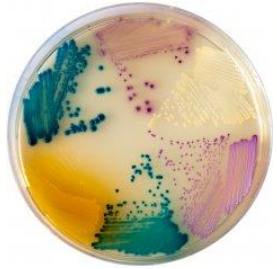


Finer et al, *Lancet ID* 4(10) 2004

Children's Hospital of Philadelphia®

CURRENT TESTING FOR UTI

- Gold standard = Urine Culture
  - Generally 1st or 2nd highest volume testing in clinical microbiology laboratories
  - Semi-quantitative plating
    - Significance of quantity varies by population
  - Pathogen identification
    - Chromagar
    - MALDI-TOF mass spectrometry
    - Automated biochemical identification
  - Antimicrobial susceptibility testing (AST)



Timeline:

18-24 hours

<1 hour

18-24 hours

18-24 hours

Total time = 18-24 hours for negative
36-72 hours for ID/AST

Need faster way to predict who has a UTI

CURRENT TESTING FOR UTI

- Urinalysis
  - Point of care
  - Rapid automated
- In-house defined criteria for “positive”
  - Highly variable
  - Impacts sensitivity and specificity
- Numerous large clinical studies
  - Wide range for sensitivity and specificity
    - Some studies as low as 50% for both

OVERTREATMENT AND STEWARDSHIP

- Asymptomatic bacteriuria
  - Positive urine culture in the absence of symptoms
- Limitations of current approaches to UTI testing
  - Non-specific screen (urinalysis)
  - Slow confirmatory testing (culture)

OVERTREATMENT AND STEWARDSHIP

- Asymptomatic bacteriuria (AsB) is common
  - Higher rates with catheterization
    - Est 3-10% per day risk of bacteriuria
  - AsB is a risk factor for UTI
  - Screening and treatment of AsB only recommended for:
    - Pregnant women
    - Prior to invasive urologic procedures
  - Inappropriate testing for and treatment of AsB is common
    - 20-80% of AsB inappropriately tested/treated
    - Factors that influence treatment include age of patient and laboratory test results

Trautner et al, *CID* 48(9) 2009
Shales et al, *CID* 25(3) 1997

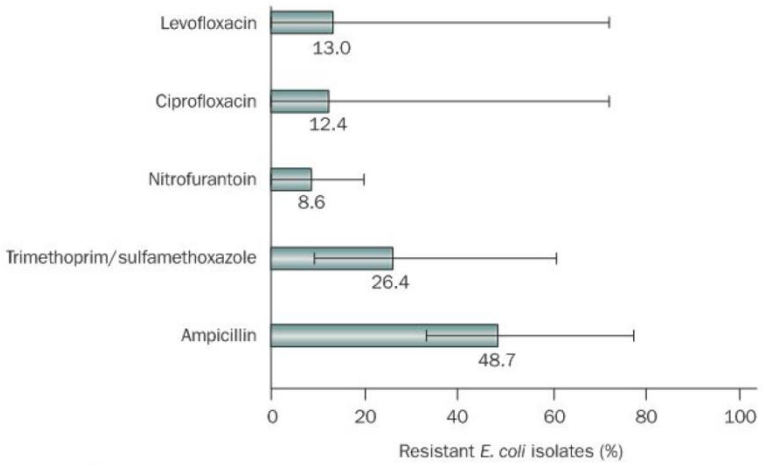
OVERTREATMENT AND STEWARDSHIP

- Non-specific screen paired with delayed confirmatory testing
- Prospective adult ED study[1]
  - 47% of patients received treatment for a positive UA but had a negative culture
  - 13% of patients were symptomatic with a positive culture but had a negative UA
- Pediatric retrospective analysis[2]
  - ~50% of patients treated for UTI did not need therapy
    - Culture negative
    - Most had "positive" urinalysis
  - Treated with agents for which resistance is increasing

[1]Lammers et al, *Ann Emerg Med* 38(5) 2001
[2]Watson et al, *Pediatric Emer Care* 34(2) 2018

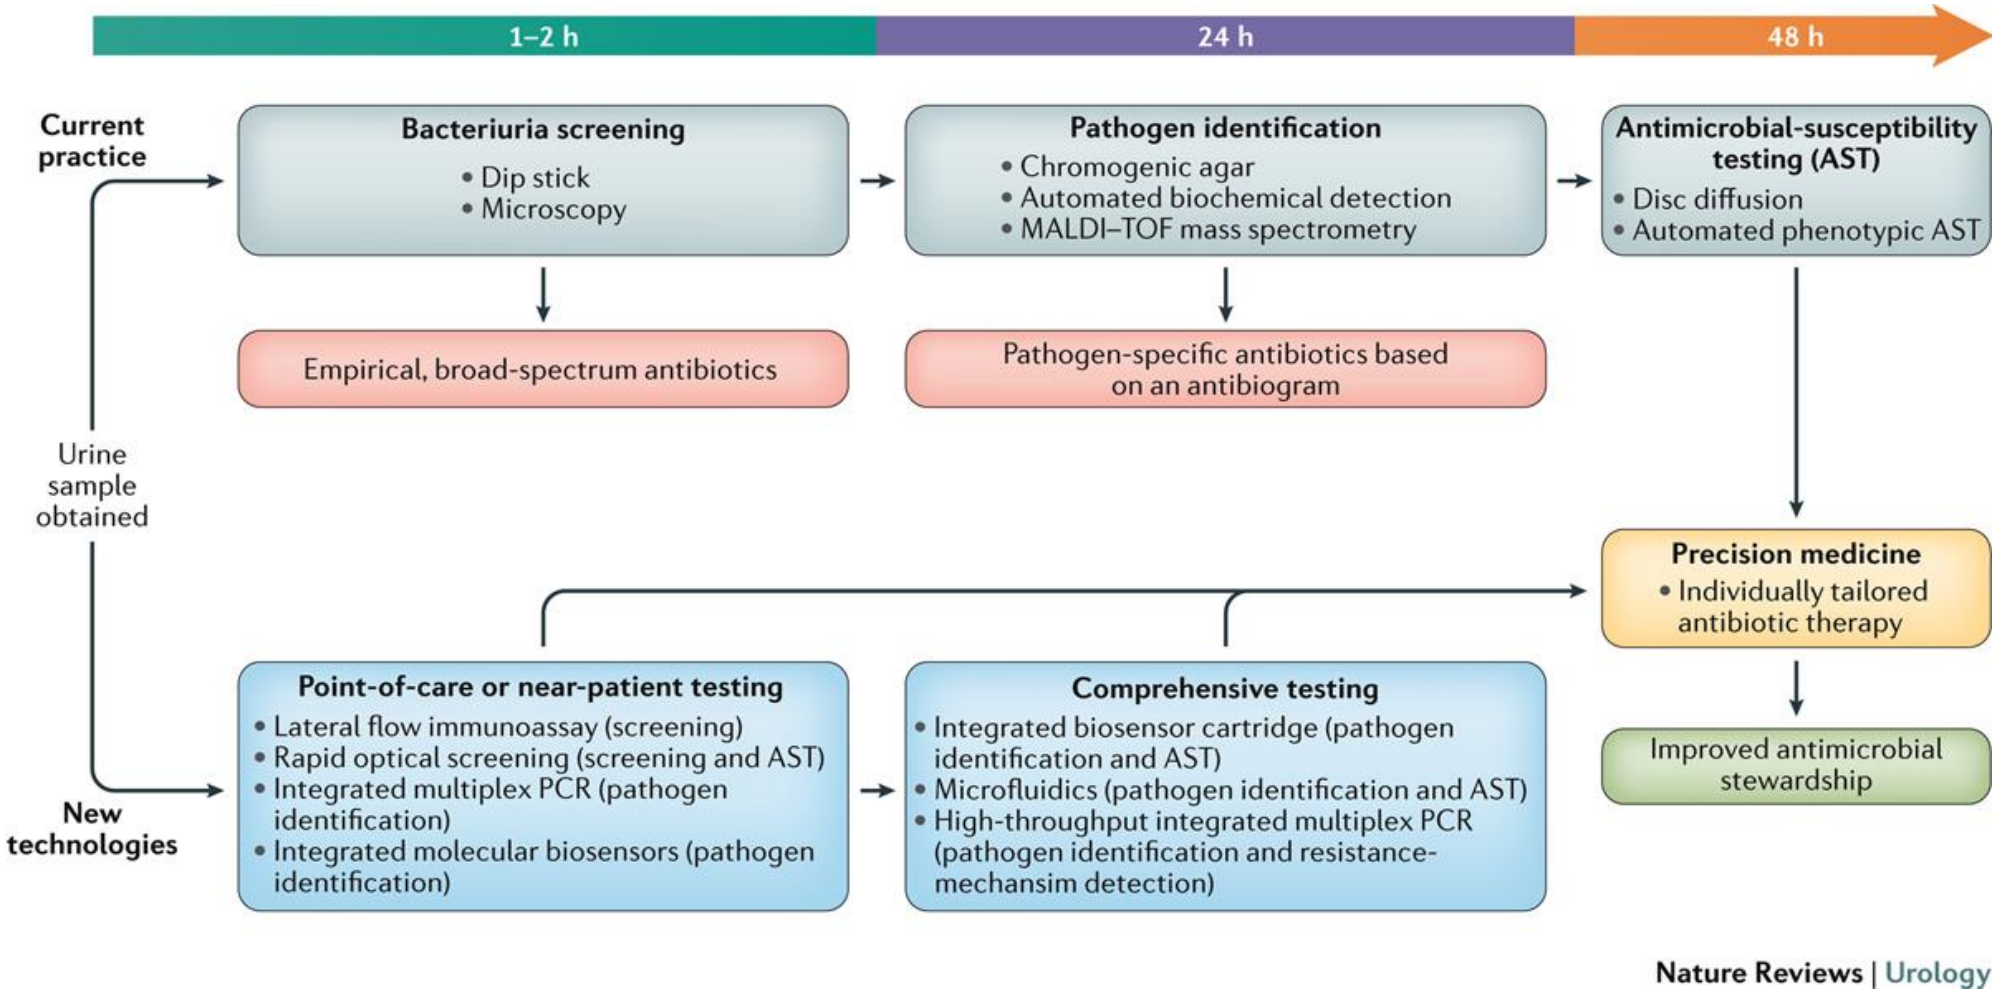
OVERTREATMENT AND STEWARDSHIP

- Impact of overtreatment
  - Individual risks
    - Alterations in microbiome
    - *Clostridium difficile* disease
    - Selection for antimicrobial resistant organisms for next UTI
  - Population risks
    - Spread of antimicrobial resistance
      - Continually increasing for TMP/SXT, Quinolones and 1st/2nd generation cephalosporins



Foxman, *Nat Rev Urol* 7(12) 2010

OVERTREATMENT AND STEWARDSHIP



Davenport, M. *et al.* (2017) New and developing diagnostic technologies for urinary tract infections *Nat. Rev. Urol.* doi:10.1038/nrurol.2017.20

Children's Hospital of Philadelphia®

FASTER AND MORE ACCURATE UTI DIAGNOSIS

Diagnostic Goals:

- Treat only those with symptomatic UTI — Rapidly identify negatives
  - Avoid treating symptomatic patients without UTI
- Treat with pathogen-targeted therapy — Rapidly identify bacterial species in positives
- Treat with pathogen-susceptible therapy — Rapidly perform susceptibility testing

EMERGING METHODS FOR FASTER UTI DIAGNOSIS

- Flow cytometry
- MALDI-TOF Mass Spectrometry (MS)
- Molecular approaches
- Laser light scattering

FLOW CYTOMETRY

- FDA cleared platforms for sediment portion of UA
  - User defined cutoffs impact sensitivity and specificity
    - Broeren et al showed 80% specificity with 0.3 false negative rate[1]
    - Inigo et al showed 79% specificity with 1.9% false negative rate[2]
- Advanced models with capacity to discriminate Gram-negative from Gram-positive bacteria
  - Based on differential dye uptake and light scatter profiles
- Provide bacterial counts per microliter

[1]Broeren et al *J Clin Microbiol* 49, 2011
[2]Inigo et al *Clin Chem Acta* 456, 2016

FLOW CYTOMETRY

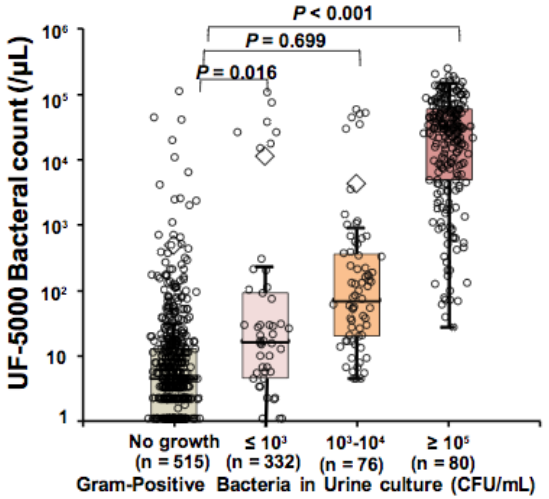
Bact Info flag from urine culture identification or by Gram stain	UF-5000 Bact Info flag gram NEG?
Gram negatives	411
Gram positives + Gram negatives	24
Mixed flora (All the samples showed presence of Gram negatives)	39
Gram positives	1
Yeasts	0
Culture negative (no growth or <10^5CFU/mL)	18
Total	493

De Rosa et al, *Clin Chim Acta* 484, 2018

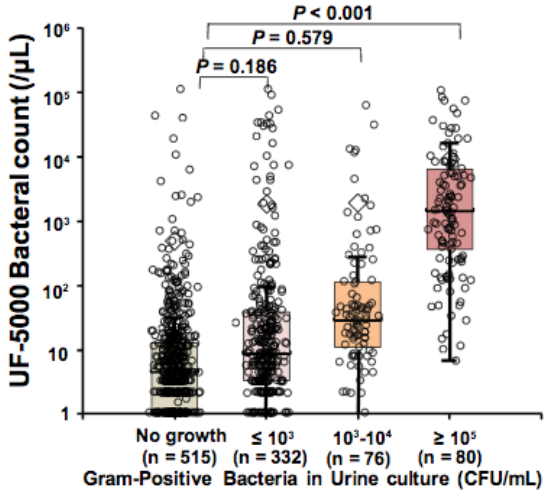
93% specific for GN

90% specific for GN in second recent study:
Kim et al *J Clin Micro* doi:10.1128/JCM.02004-17, 2018

Gram negatives



Gram positives



Children's Hospital of Philadelphia®

FLOW CYTOMETRY

- FDA cleared platforms available
- High throughput and fast
- Good performance to screen negatives
- User defined criteria and validation needed
- Bacterial differentiation shows promise but ~90% specific for GN

MALDI-TOF MS DIRECTLY FROM URINE

- MALDI-TOF MS widely used for bacterial identification in clinical laboratories
- Instruments have reference spectra for UTI-associated bacteria
- Urine has low human protein content
- Instruments have limit of detection ~10,000 colony forming units
  - Concentrate bacteria from 1mL of urine

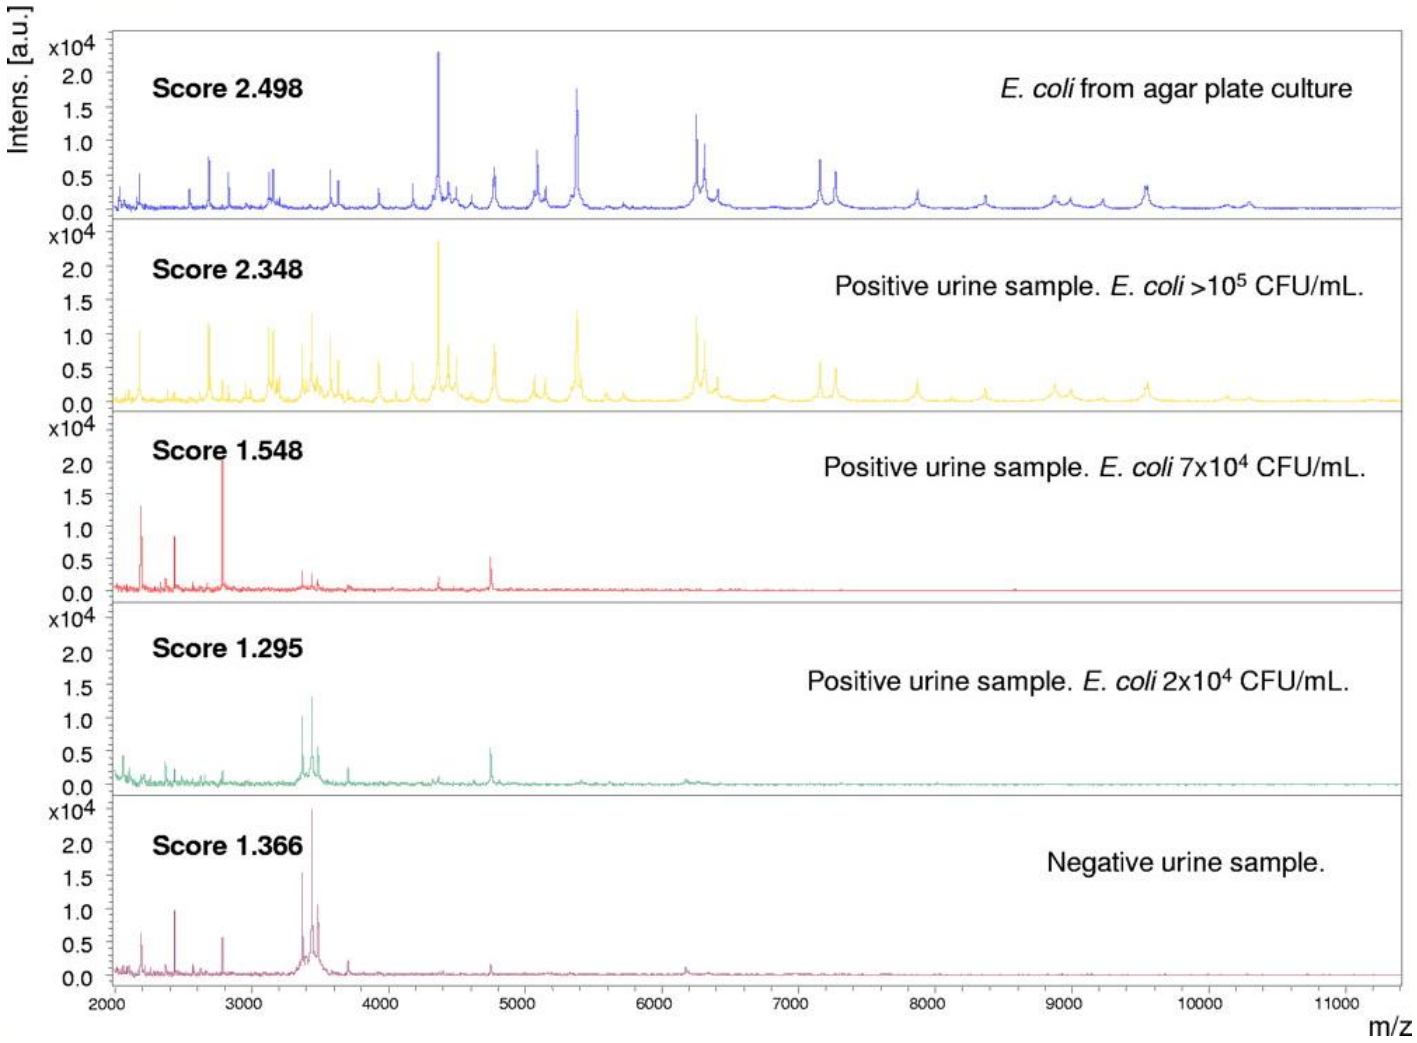
MALDI-TOF MS DIRECTLY FROM URINE

Slow spin to remove white cells

Fast spin to pellet bacteria

Washes to eliminate interference

MALDI-TOF MS DIRECT FROM URINE



Ferreira et al. J Clin Microbiol. 2010;48:2110-2115

Children's Hospital of Philadelphia®

MALDI-TOF MS DIRECT FROM URINE

Conventional identification (no. of cases)	MALDI-TOF MS identification (no. of cases)
Negative (20)	Negative (20)

Total (220)	91.8	92.7	

Ferreira et al. J Clin Microbiol. 2010;48:2110-2115

MALDI-TOF MS DIRECT FROM URINE

- Performs well for mono-microbial UTI >100,000 cfu/mL
  - Species identification in <1 hour
- Inexpensive for labs with MALDI-TOF MS
- Cumbersome laboratory developed protocols
  - Labor-intensive
  - No FDA approved approaches
- Sensitivity lower than needed for screening
  - Maximum reported sensitivity of 88%*
  - Negatives would still need to be plated

*Wang et al, *J Microbiol Methods* 92(3) 2013

MOLECULAR

- Amplification and detection of most common pathogens
  - Sequenced-based approaches may allow for pan-pathogen detection
- Possibility for quantification
- Laboratory developed assays
- Modifications of commercially available assays

MOLECULAR

- Modification of a commercially available PCR
  - PCR designed for Sepsis

	Exclusively Microbiology positive	Exclusively SeptiFast® positive	Microbiology and SeptiFast® positive	Microbiology and SeptiFast® negative	Concordance [%]
Escherichia coli	4	1	32	45	77/82 [94]
Klebsiella pneumonia	2	0	6	74	80/82 [98]
Serratia marcescens	0	1	0	81	81/82 [99]
Enterobacter	1	2	0	79	79/82 [96]
Proteus mirabilis	2	0	0	80	80/82 [98]
Pseudomonas aeruginosa	0	2	1	79	80/82 [98]
Coagulase-negative staphylococci	14	3	7	58	65/82 [79]
Staphylococcus aureus	1	2	2	77	79/82 [96]

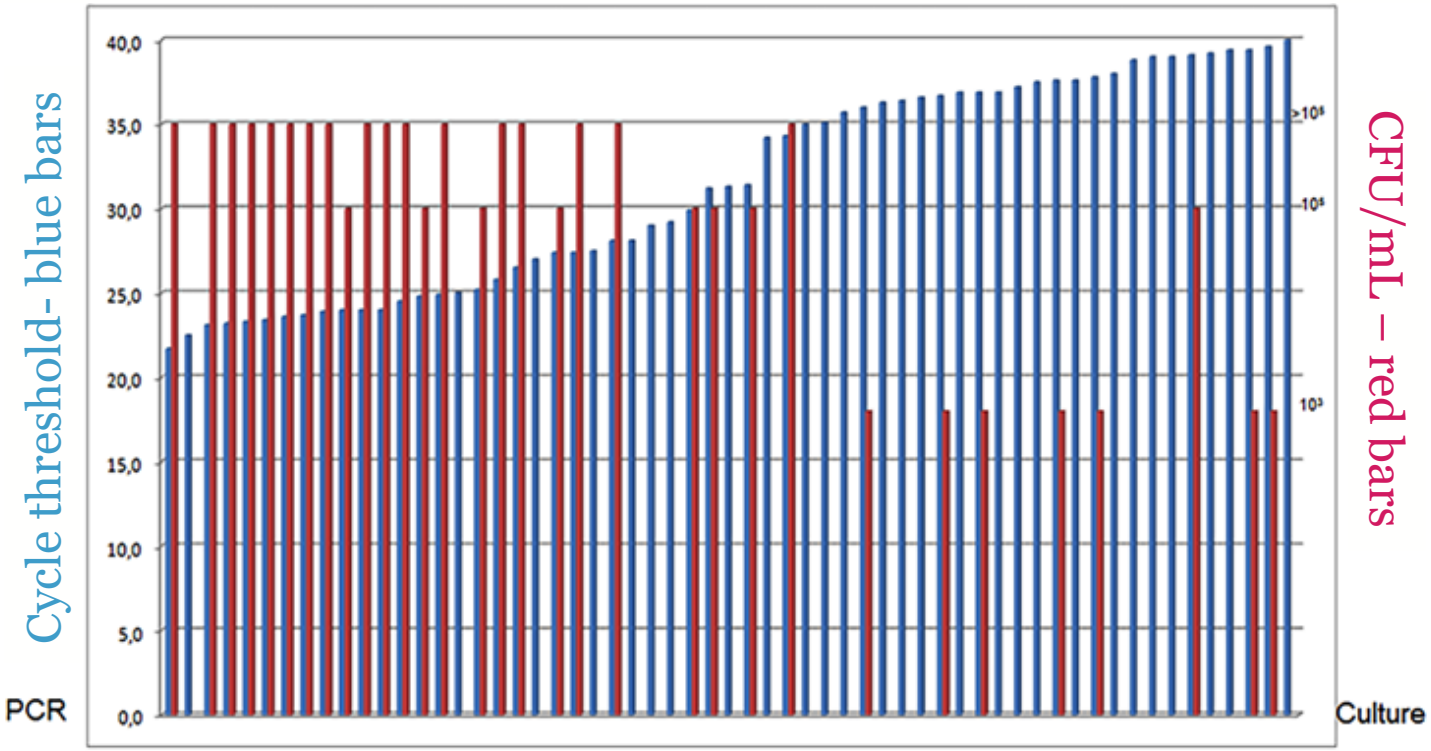
Candida crusei	0	0	1	81	82/82 [100]

82% Sensitivity
60% Specificity

Lehmann LE et al, *PLOS ONE* 6(2): e17146 2011

MOLECULAR

- Laboratory developed PCR and the potential for quantitative analysis



Van der Zee et al *PLOS One* 11(3) 2016

Children's Hospital of Philadelphia®

MOLECULAR

- No FDA approved assays available
  - Extensive validation required
- Expensive
- Likely need to batch, slows down turn around time
- Too sensitive in some settings
  - Increased detection of urogenital flora

LIGHT SCATTER DETECTION

- Early models commercially available over 30 years ago
- BacterioScan 216Dx UTI System
  - FDA approved in May of 2018
  - Measures urine + broth turbidity over ~3 hours
  - Software interprets turbidity into growth curve
  - Negative results can be reported at ~3 hour mark
    - No need for downstream culture
  - Positive results reflex to culture
  - LOD of 10,000 cfu/mL

Children's Hospital of Philadelphia®

LIGHT SCATTER DETECTION

- Prospective pediatric study
  - Comparison with conventional culture of 439 specimens
  - 307 Clean catch and 132 straight catheterized specimens
  - 86 (19.6%) culture positive with significant quantity of uropathogen
    - 73 (85% of positives) with >100,000 cfu/mL of *E. coli*

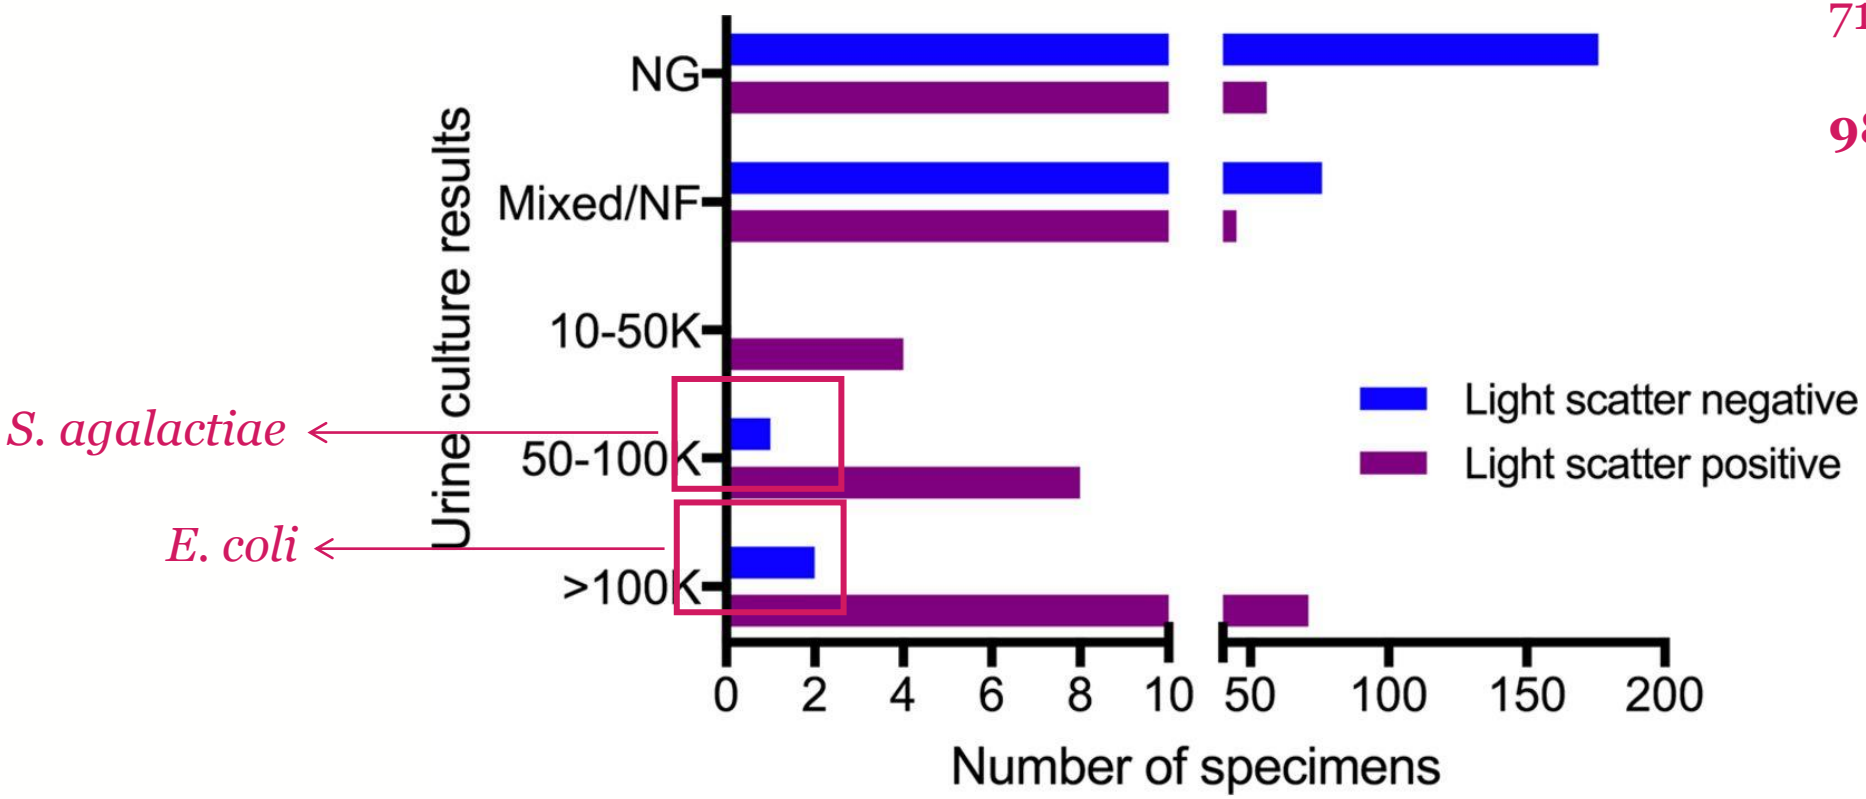
Montgomery et al. J. Clin. Microbiol. 2017;55:1802-1811

LIGHT SCATTER DETECTION

- Prospective pediatric study

96.5% Sensitivity
71.4% Specificity

98.8% NPV



Montgomery et al. J. Clin. Microbiol. 2017;55:1802-1811

Children's Hospital of Philadelphia®

LIGHT SCATTER DETECTION

- Similar sensitivity and NPV in clinical trial (50,000 cfu/mL cutoff)
  - 97.7% sensitivity
  - 99.2% NPV
- Limit of detections above 10,000 cfu/mL for several clinically relevant organisms:
  - *P. aeruginosa*
  - *S. saprophyticus*
  - *S. agalactiae**
  - *Aerococcus sp.*
  - *C. urealyticum*

*Our study detected 2/2 with 10-50K and 2/3 with 50-100K of *S. agalactiae*

Our study did not evaluate *Aerococcus sp.* or *C. urealyticum*

P. aeruginosa and *S. saprophyticus* positives were above 100K

LIGHT SCATTER DETECTION

- Prospective adult study
  - 610 urine samples
    - 588 clean catch
  - 138 (23%) with significant quantity of uropathogens
- 76% Sensitivity
  - 30 false negatives
    - Unclear if these could be asymptomatic bacteriuria

False Negative Bacterioscan

Organism	Quantity (CFU/mL)			
	$>1 \times 10^5$	5×10^4 - 1×10^5	1×10^4 - 5×10^4	$<1 \times 10^4$
Enterobacter aerogenes	0	0	1	0
Pseudomonas aeruginosa	0	0	2	0
Streptococcus agalactiae	0	0	2	2
Escherichia coli	0	3	3	0
Yeast (Candida spp.)	0	0	6	0
Klebsiella pneumoniae	0	1	3	0
Klebsiella oxytoca	0	0	1	0
Stenotrophomonas maltophilia	0	1	0	0
Proteus mirabilis	0	0	1	0
Enterococcus faecalis	0	0	1	0
Enterococcus faecium	0	0	2	0

Roberts et al *Lab Med* 49(1) 2017

LIGHT SCATTER DETECTION PAIRED WITH ID AND AST

- Can we provide rapid identification and faster AST of positives in addition to screening negatives?
  - Avoid treatment of symptomatic patients without UTI
  - Treat with pathogen-targeted therapy
  - Treat with pathogen-susceptible therapy

Measure OD

2 min. spin to pellet bacteria

MALDI-TOF MS identification

AST

LIGHT SCATTER DETECTION

- FDA approved platform
  - Does not require user defined criteria/validation
- Cost-benefit may be reduction in antibiotic use
  - Post-implementation studies are needed
  - ~3 hour time to negative result may still be too slow
- Reduced burden for plating and culture reading in microbiology laboratories
- MALDI-TOF MS protocols for rapid identification insensitive
  - Alternative approaches for rapid identification
- Potential for rapid AST in addition to detection

UTI AND ANTIMICROBIAL STEWARDSHIP

Diagnostic Goals:

- Treat only those with symptomatic UTI — Rapidly identify negatives
  - Avoid treating symptomatic patients without UTI
- Treat with pathogen-targeted therapy — Rapidly identify bacterial species in positives
- Treat with pathogen-susceptible therapy — Rapidly perform susceptibility testing

THE FUTURE OF ANTIMICROBIAL STEWARDSHIP FOR UTI

- Platforms now FDA approved that allow for faster and more accurate identification of UTI
  - Reduce pool of negative specimens for culture
  - Avoid treatment of patients that would have negative cultures
- Potential for rapid ID and AST
  - Technology in development
  - Faster pathogen-targeted and individually tailored antimicrobial therapy

THE FUTURE OF ANTIMICROBIAL STEWARDSHIP FOR UTI

- Reduce the over-treatment of UTI
  - Clinicians can wait for more reliable laboratory result before treating
- Reduce the contribution of UTI over-treatment to antimicrobial emerging resistance
- Partnership between laboratories and stewardship prior to implementation of new technology
  - Prospective studies are needed
