When You Need a Simple Sample Screening Solution

If you need to investigate multiple analytes, traditional complex sample screening methods, such as Western blot and immunoprecipitation can be expensive in time and money.

Proteome Profiler Antibody Arrays offer quick and inexpensive analysis of multiple analytes in a simple assay. Using a simple two site sandwich assay principle, it allows investigation of up to 119 analytes in a single sample.

With 30 different arrays available for use with multiple validated sample types, there is always an Array that can help accelerate your research.

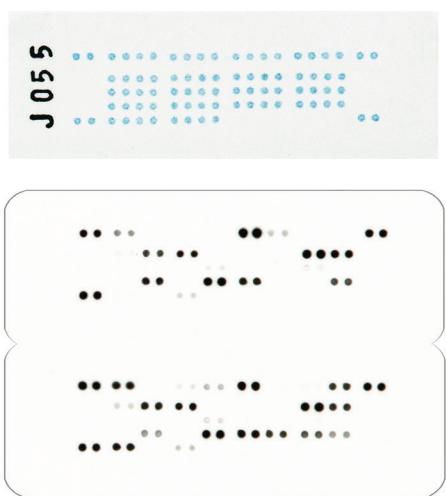

Simple Technology that doesn't need Specialized Equipment

If your lab is set up for Western blotting, then you already have all the equipment needed to use our antibody arrays.

Samples are simply incubated with membranes spotted with specific capture antibodies. Captured analyte is detected using a cocktail of biotinylated antibodies and positive spots are visualized using an appropriate detection system.

Superior Performance & Conscientious Design

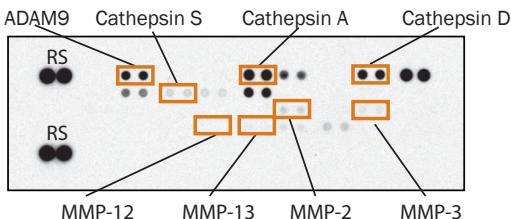

Human Cytokine Array Panel A ([Cat# ARY005B](#)) PBMCs untreated (top) or treated with 10 µg/mL PHA for 5 days (bottom). 500 µL of cell culture supernate was run on each array. A 5 minute exposure to film is shown

Simple and Powerful Sample Analysis

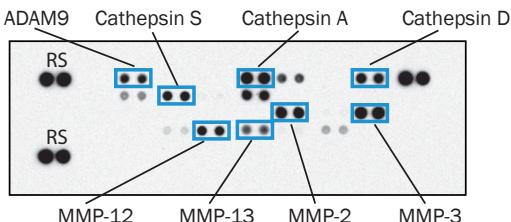

Cost-Effective Analyte Profiling

Quickly identify the changes of multiple analytes in your samples using Proteome Profiler Arrays. Move your research forward quickly by easily profiling analyte levels and identification of trends between and within samples – all from a single assay.

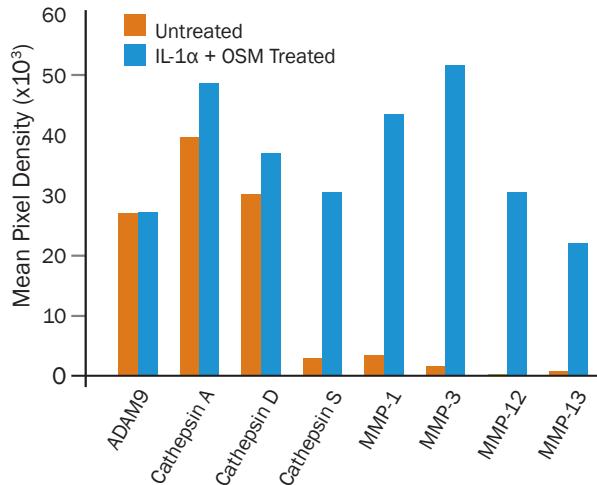

A. Untreated

B. IL-1 α + OSM Treated

C. Untreated vs IL-1 α + OSM Treated

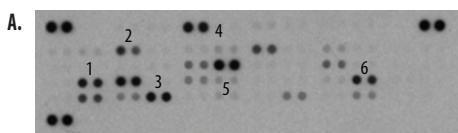

Simultaneous Detection of Multiple Proteases Following Treatment with IL-1 α and Oncostatin M (OSM) The Proteome Profiler Human Protease Antibody Array (Catalog # ARY021B) was used to simultaneously assess protease levels in human chondrosarcoma cell lysates. Cells were either untreated (A) or treated (B) with Recombinant Human IL-1 α (Catalog # 200-LA) and Recombinant Human OSM (Catalog # 295-OM). Chemiluminescence was detected using x-ray film and histogram profiles (C) for select analytes were generated by quantifying the mean spot pixel densities using standard imaging software.

Choose the Detection Method that Best Fits Your Needs

Results can be visualized on all arrays using supplied optimised chemiluminescent substrates. To give you choice, LI-COR near-infrared (NIR) fluorescent detection can also be used on select arrays. For protocol information go to this link: rndsystems.com/protocols.

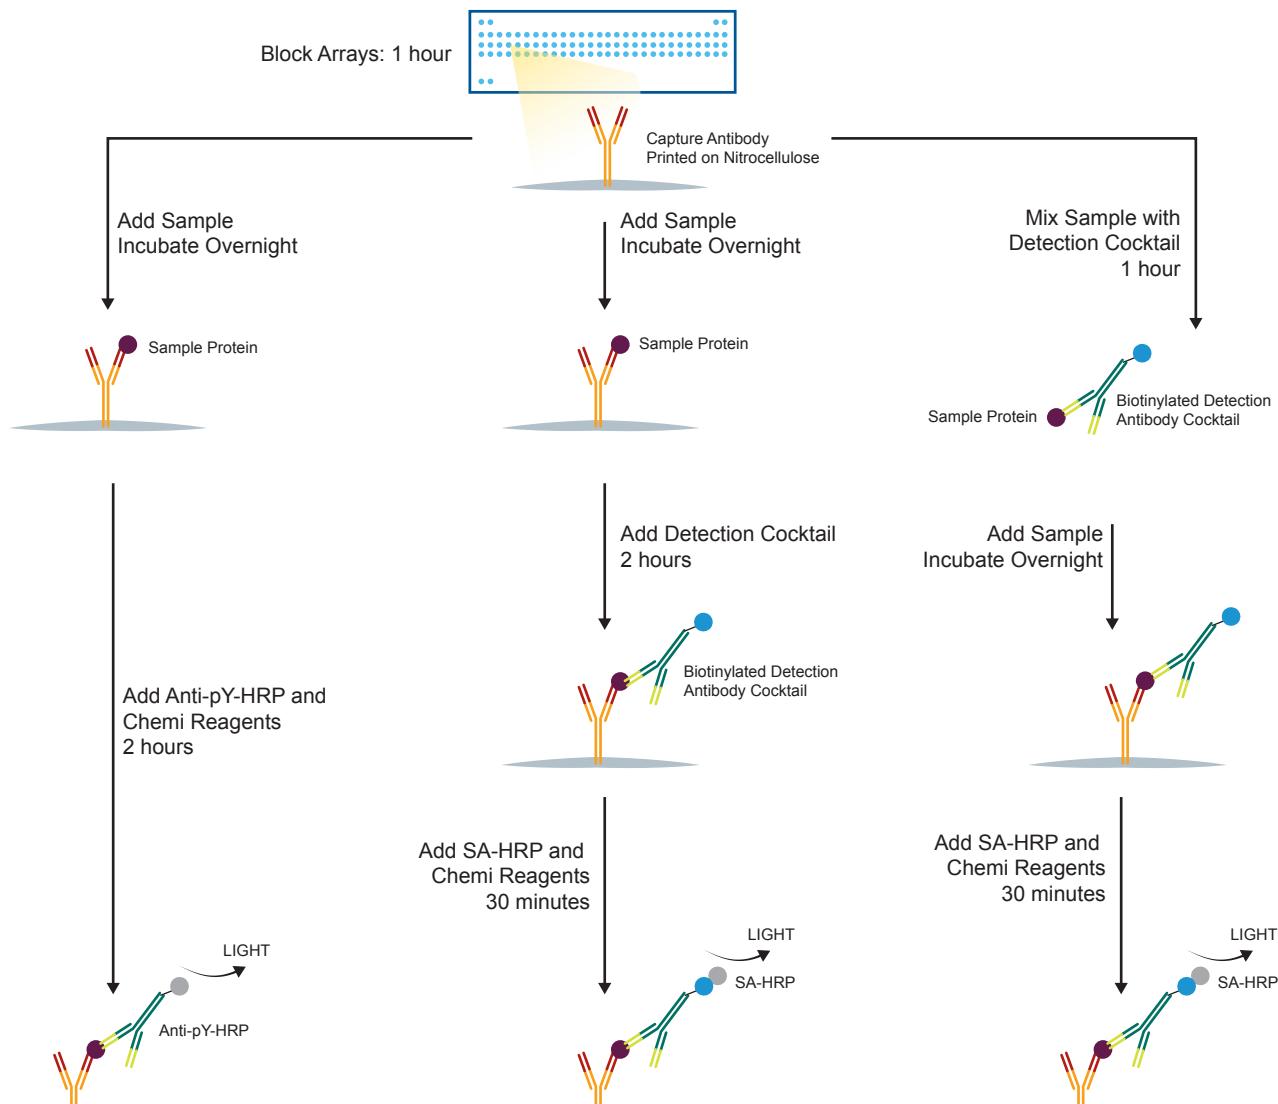

Both chemiluminescence and fluorescence based Proteome Profiler™ Antibody Array Kits can be quickly and accurately analyzed by FluorChem™ systems with AlphaView software. For more information: rndsystems.com/fluorchemdata

A chemiluminescence image on X-ray film of a Proteome Profiler Human Angiogenesis Array (Catalog # ARY007) (A) is compared to an image where IRDye 800CW Streptavidin (LI-COR Catalog # 926-32230) was used in place of Streptavidin-HRP (B). LI-COR software was used to perform image analysis for select analytes.

Multiple Analyte Results in only 5.5 Hours

To help you make the most of your time and resources, all Array protocols are streamlined to make sure you can get results quickly and simply.
